The world is changing faster than ever, and the rules for project success are changing with it. In the past, projects were often planned and executed in a waterfall manner, with each phase being completed sequentially before the next phase could begin. This approach worked well in a relatively stable environment, but it is no longer effective in today's rapidly changing world.

In today's world, projects need to be able to adapt to change quickly and efficiently. This requires a new approach to project management, one that is more agile and flexible. Agile project management methodologies, such as Scrum and Kanban, allow teams to respond to change quickly and effectively, and they have been shown to increase project success rates.

In addition to being agile, projects also need to be lean. This means that they need to be executed with the minimum amount of waste. Lean project management techniques, such as Six Sigma, can help teams to identify and eliminate waste, and they can improve project efficiency and quality.

Finally, projects need to be delivered in a timely manner. In today's fast-paced world, customers are no longer willing to wait months or even years for a project to be completed. Projects need to be delivered on time and within budget, or they will not be successful.

The new rules for project success in a sped up world are: **be agile, be lean, and deliver on time and within budget**. These rules are essential for any project that wants to be successful in today's rapidly changing environment.

## **How to Be Agile**

There are a number of ways to make your projects more agile. One is to use an agile project management methodology, such as Scrum or Kanban. These methodologies allow teams to work in short iterations, and they provide a framework for teams to respond to change quickly and effectively.

Another way to be agile is to create a culture of continuous improvement. This means that teams are constantly looking for ways to improve their processes and their products. Continuous improvement can help teams to identify and eliminate waste, and it can improve project efficiency and quality.

## **How to Be Lean**

There are a number of ways to make your projects more lean. One is to use lean project management techniques, such as Six Sigma. Six Sigma is a data-driven approach to process improvement that can help teams to identify and eliminate waste.

Another way to be lean is to focus on customer value. This means that teams should only work on features that are valuable to the customer. Teams should also work to reduce the cost of developing and delivering features.

## **How to Deliver on Time and Within Budget**

There are a number of ways to deliver your projects on time and within budget. One is to plan your project carefully and to set realistic goals. It is also important to track your progress regularly and to make adjustments as needed.

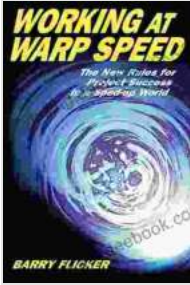

Another way to deliver on time and within budget is to use a project management tool. Project management tools can help teams to plan and track their projects, and they can help teams to identify and resolve risks early on.

The new rules for project success in a sped up world are not easy, but they are essential for any project that wants to be successful. By following these rules, you can increase your chances of success and deliver your projects on time, within budget, and to the satisfaction of your customers.
